

The A/B test brief, one page

The exact template behind a 13 for 13 spring. If you can't fill every field honestly, the test isn't ready to build.

THE THREE RULES

1. No test without an observation. Start from data you can point at, never from taste.
2. The hypothesis names the metric. "If we [change], [metric] goes up, because [mechanism]."
3. Measure revenue per session, not clicks. Clicks flatter you. Revenue doesn't lie.

1 • OBSERVATION

What the data shows, with the number. Example: "87% of sessions are mobile; average PDP dwell is 74 seconds; shoppers scroll past Add to Cart and never scroll back."

2 • HYPOTHESIS (ONE SENTENCE, NAMES THE METRIC)

"If we add a sticky Add to Cart bar on mobile, revenue per session goes up, because the button stays visible when intent peaks."

3 • WHAT WE'RE BUILDING

The concrete change, small enough to isolate. One variable per test unless you're running A/B/C on placements.

4 • PRIMARY METRIC

RPV or CVR. Secondary: ATC, AOV.

5 • DEVICE & PAGES

e.g. mobile only • all PDPs

6 • DURATION & SAMPLE

Full weeks, minimum 2 to 4. No peeking before the window closes.

7 • DECISION RULE

Ship at what significance? What happens if flat? (Hint: sharpen the variant before killing the hypothesis.)
